

# Robotics and Autonomous Systems

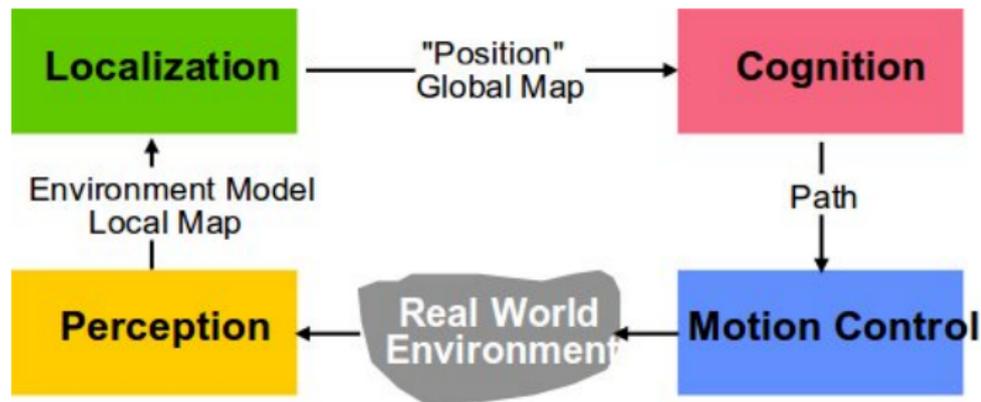

## Lecture 14: Communication and other useful things

Richard Williams

Department of Computer Science  
University of Liverpool

UNIVERSITY OF  
LIVERPOOL

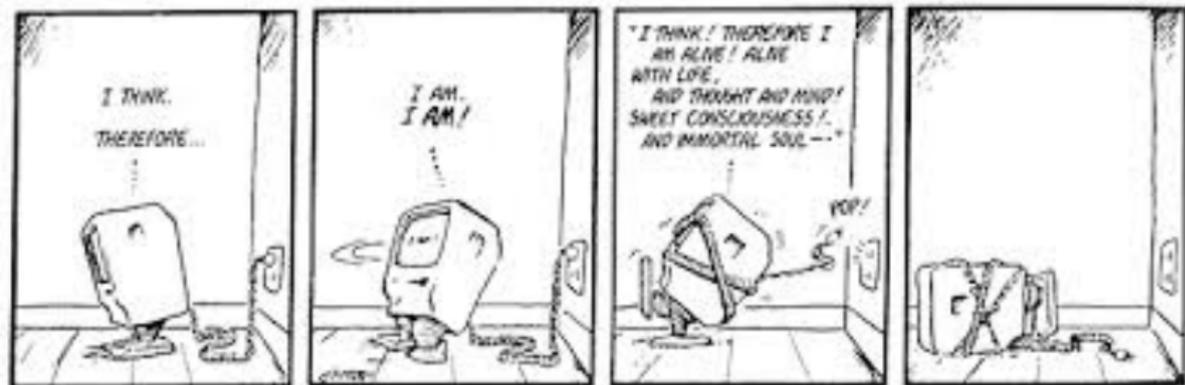

- We will cover things from all parts of robotics

- Basically a bit of a ragbag of topics
  - All LeJOS stuff
- Things that will help with the assignments.

- Connectivity:
  - USB cable  
Fast, reliable but limited by cable range.
  - Bluetooth  
Slow, unreliable but flexible.
- Connectivity via Bluetooth is achieved through the BlueCove Java library for Bluetooth.

# Relying on the cable causes problems

- Bloom County, Berkeley Breathed

- Bluetooth was originally conceived as a wireless alternative to RS-232 data cables.
- Developed by Eriksson in 1994.
- Bluetooth technology exchanges data over short distances using radio transmissions.
- Bluetooth technology operates at 2.4 to 2.485 GHz.
- The 2.4 GHz ISM band is available and unlicensed in most countries.
  - Unlicensed = heavily used

# Named after

- Harald “Bluetooth” Gormsson (Haraldr blátǫnn Gormsson, Old Norse)
- King of Denmark around 960-980.
- Unified several Scandinavian kingdoms.

# Named after

- Communication works as follows:
  - A connection is established by an Initiator to a Receiver (who waits for a connection to be established).
  - Once a connection is established, both ends can open input and output streams, read and write data.
  - The Initiator program is usually assumed to run on a PC
- Here, we will focus on how the NXT brick can communicate to the console on your PC via Bluetooth
- Can also connect two NXTs

- LeJOS comes with a number of tools for communicating between a PC and the NXT brick.
  - `nxjbrowse`—a browser for `nxj` files on the NXT brick
  - `nxjconsoleviewer`—GUI viewer for `RConsole` output
  - `nxjcontroller`—extends the `ConsoleViewer` with monitoring functionalities for `.nxj` programs
- These can all be installed and run from Eclipse (install via the “External Tool Configuration” toolbar)  
Run > External Tools  
    > External Tools Configuration

# LeJOS communication tools

The screenshot displays the Eclipse IDE interface for a Java project named 'CommToConsole'. The Package Explorer on the left shows the project structure, including packages like 'src', 'LeJOS NXT Runtime', and 'CommToConsole'. The main editor window shows the source code of 'CommToConsole.java'. A 'Run' menu is open, showing various options such as 'Run', 'Debug', 'Run History', 'Toggle Breakpoint', and 'External Tools'. The 'External Tools' submenu is also visible, showing 'File Browser' and 'Remote Console Viewer'. The console window at the bottom shows a terminated process and a stack shutdown message.

```
import java.util.*;
import java.io.*;
import java.net.*;

public class CommToConsole {
    private static final int PORT = 8080;
    private static final int TIMEOUT = 10000;

    public static void main(String[] args) {
        try {
            ServerSocket serverSocket = new ServerSocket(PORT);
            while (true) {
                try {
                    Socket socket = serverSocket.accept();
                    new Thread(new SocketHandler(socket)).start();
                } catch (IOException e) {
                    e.printStackTrace();
                }
            }
        } catch (IOException e) {
            e.printStackTrace();
        }
    }

    private static class SocketHandler implements Runnable {
        private Socket socket;

        SocketHandler(Socket socket) {
            this.socket = socket;
        }

        public void run() {
            try {
                BufferedReader in = new BufferedReader(new InputStreamReader(socket.getInputStream()));
                String line = in.readLine();
                if (line != null) {
                    System.out.println("Received: " + line);
                }
            } catch (IOException e) {
                e.printStackTrace();
            }
        }
    }
}
```

Console Output:

```
<terminated> File Browser [Program] C:\Program Files\LeJOS NXT\bin/browse.bat
BlueCove version 2.1.0 on wInsock
BlueCove stack shutdown completed
```

- When you do this, you will need to browse for the relevant files:  
Program File > leJOS NXJ > bin
- The files are .bat files.
- Then you can run these tools from the Run menu.

# LeJOS communication tools

- For example, the remote console

- Can't do anything until you connect to the robot.
- PS. Can connect through the USB and run all the tools.

# Setting up to communicate by Bluetooth

- Setting up a connection between PC and robot is a pain.
- There are four steps before you do this for the first time:
  - 1 Get NXT Bluetooth PIN
  - 2 Turn on Bluetooth on NXT
  - 3 Pair Bluetooth and PC
  - 4 Open up a connection.

# Step 1

- First you have to mess with the connection from the NXT side.
- Go to  
Bluetooth > Change PIN  
on the NXT menu system.
- This will display a number.
- On my robot this was:  
1 2 3 4  
which looks like the default to me.
- Look this up and write it down.

## Step 2

- Turn on Bluetooth on the robot.
- Go to Bluetooth on the NXT menu.
- You may have to repeat this periodically.

## Step 3

- Set up the PC to talk to the robot.
- Find the bluetooth symbol on the menubar at the bottom of the screen.

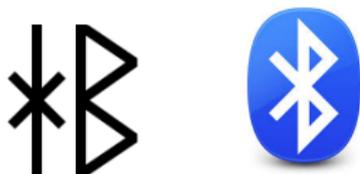

- Click it and pick the “Add a device” option.
- The dialogue should pick up your robot (if the bluetooth is on).
- It will also need a “pairing code”.
- This is the PIN you wrote down before.

- The blue tooth logo is the merge of pair of runes.

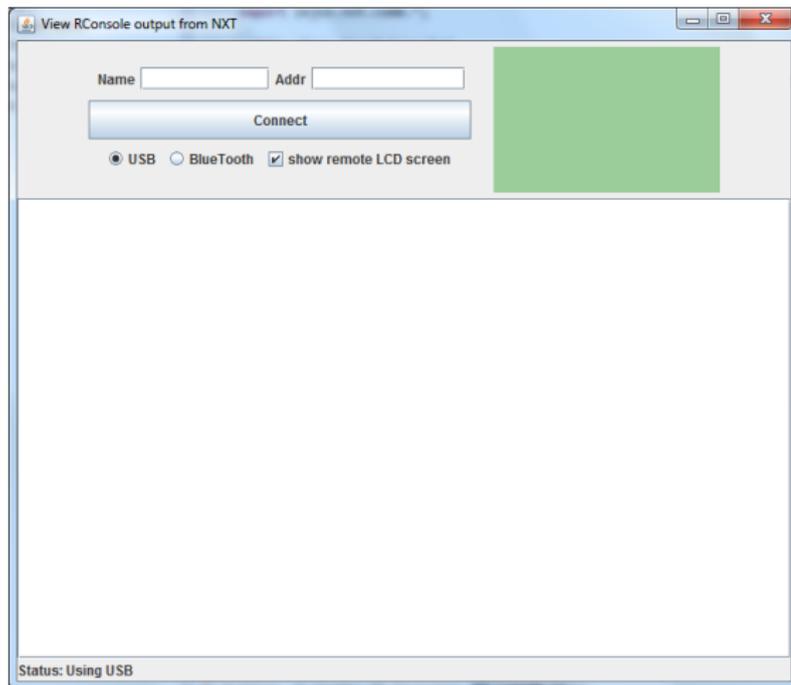

- The rune for h, and the rune for b

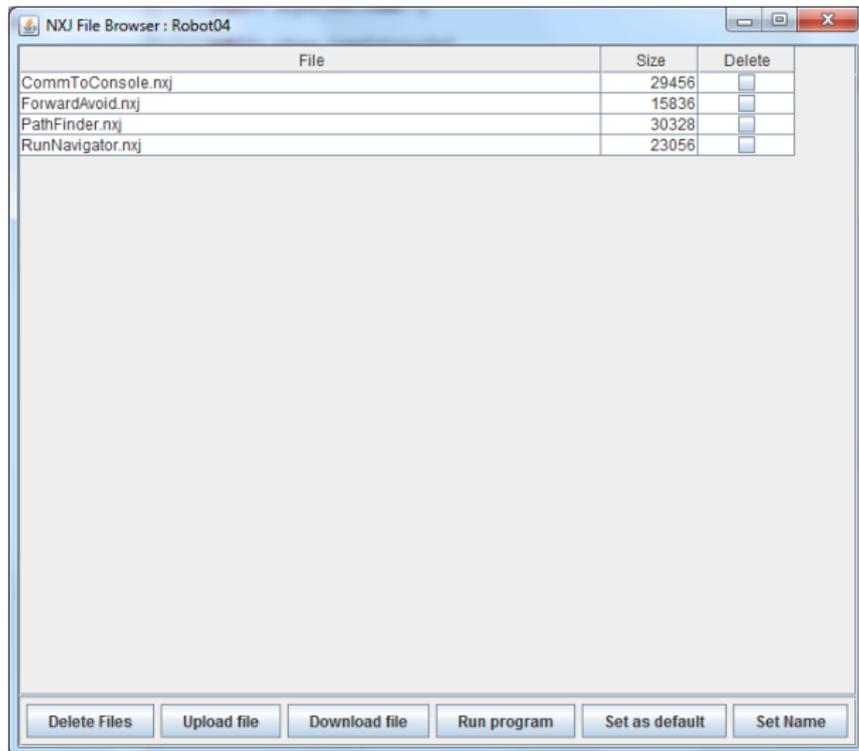

# Step 4

- Now you can open up a connection.

# File Browser

# Controller

The NXI Control Center window displays a table of connected devices and a sensor monitoring section.

Name	Protocol	Address	Status
Bumblebee	Bluetooth	00165311176B	DISCONNECTED
Robot04	Bluetooth	0016531AA711	LCP_CONNECTED

Buttons: Search, Disconnect

Radio buttons:  USB  Bluetooth  Both  
 LCP  RConsole  Data Log

Tabbed interface: Files, Settings, Monitor, Control, Miscellaneous

**Sensor Monitoring Section:**

Set Sensor type & mode  
Port: S2  
Type: Touch Sensor  
Mode: Raw  
Set Sensor

Sensor Port	Raw Value	Scaled Value	Mode
Sensor Port 1	8197	-1	No Sensor
Sensor Port 2	1023	1023	Touch Sensor
Sensor Port 3	-1	-1	No Sensor
Sensor Port 4	-1	-1	No Sensor

Update button

# Controller

# Issues with Bluetooth

- Pairing: You may have to go through the setup procedure everytime you use a robot — NXTs change.
- Pairing: You may find your robot is paired with someone else's PC.
- Pairing: You may find your PC is paired with someone else's robot.
- Interference: many bluetooth devices close together:
  - multiple robots,
  - phones,
  - computers,
  - tablets

will impede communication.

802.11 also uses the 2.4 GHz band.

# Programs that communicate

- Once again, LeJOS (and Java) make doing complicated things quite easy.
- The `RConsole` class gives us a way to communicate from the NXT to the remote console program running on the PC.
- Open a connection, no timeout  
`open()`
- Close a connection  
`close()`
- Send text to the console  
`println(String s)`

# Programs that communicate

- Here's part of a program `CommToConsole.java` that you can get from the module website.

```
public class CommToConsole{
    public static void main (String[] args)
        throws Exception{
        DifferentialPilot pilot
            = new DifferentialPilot(3.22, 19.5,
                                   Motor.C, Motor.B);
        OdometryPoseProvider opp
            = new OdometryPoseProvider(pilot);

        Random randomGenerator = new Random();
        int move;

        RConsole.open();
```

- Only the last line is necessary to start communication.

# Programs that communicate

- Here's more of the program:

```
for(int i=0; i<10; i++){  
    move = randomGenerator.nextInt(3);  
    switch(move){  
  
    case 0:  
        System.out.println("Forward!");  
        pilot.travel(10);  
        pilot.stop();  
        RConsole.println("pose = " + opp.getPose());  
        break;
```

- Where do the two pieces of text appear?

# Programs that communicate

- Here's what a run looks like:

View RConsole output from NXT

Name  Addr

USB  BlueTooth  show remote LCD screen

```
Forward!  
Anticlockwise!  
Clockwise!  
Clockwise!  
Forward!  
Clockwise!  
Forward!
```

Console open

```
pose = X:0.0 Y:0.0 H:90.16002  
pose = X:0.0 Y:0.0 H:-179.8451  
pose = X:0.0 Y:0.0 H:89.66462  
pose = X:0.05847436 Y:9.98931 H:90.07744  
pose = X:0.05847436 Y:9.98931 H:-179.8451  
pose = X:0.05847436 Y:9.98931 H:89.66462  
pose = X:0.05847436 Y:9.98931 H:-0.4128265  
pose = X:10.10389 Y:9.916928 H:-0.1651344  
pose = X:10.10389 Y:9.916928 H:-90.49026  
pose = X:10.01842 Y:-0.07218552 H:-90.24258
```

Status: Using Bluetooth

- Check if the connection is open:  
`boolean isOpen()`
- Open connection with timeout:  
`openAny(int timeout)`
- Open bluetooth connection  
`openBluetooth(int timeout)`
- Open USB connection:  
`openUSB(int timeout)`

- Get a print stream from the console:  
`PrintStream getPrintStream()`
- This allows you to write a program (using the PC API) that runs on the PC and talks to the NXT.
- Just like Remote Console Viewer, Controller, etc.

- In addition to communication, there is one major piece that we haven't covered.
- Listeners
- Think of this as allowing us to make full use of concurrency in LeJOS.
  - No longer need to keep a busy watch on the hardware
- Instead, have the hardware tell us when something changes.
- Exactly the same kind of **event-driven** programming that we have in GUIs.

# Listeners

- In a GUI, pressing a button typically leads to an action.
- On the robot:
  - Pressing a button
  - Having a sensor change statecan lead to an action.

- Here is a button listener in LeJOS

```
import lejos.nxt.Button;
import lejos.nxt.ButtonListener;
import lejos.nxt.Motor;
import lejos.nxt.Sound;

public class myButtonListen
    implements ButtonListener{
    public void buttonPressed(Button b){
        Motor.B.stop();
        Motor.C.stop();
    }

    public void buttonReleased(Button b){
        Sound.beepSequence();
    }
}
```

- Allows you to interrupt the execution of another thread.

```
public class SimpleDriveWBL{
    public static void main(String[] args){

        Button.ENTER.addButtonListener(new myButtonListen());

        System.out.println("Press any button to start robot");
        Button.waitForAnyPress();
        LCD.clear();
        System.out.println("Press ENTER to stop robot");
        Motor.B.forward();
        Motor.C.forward();
        try{
            Thread.sleep(10000);}
        catch(Exception e){
            // Nothing
        }
    }
}
```

- You can write separate button listeners for each of the four buttons.
- You can write a general button listener that tests the ID of the calling button and acts appropriately.

# Listeners

- You can set up listeners for sensors also.

- More correctly, you set up a listener for a sensor port:

```
public class DriveWTListen{
    public static void main(String[] args){
        TouchSensor leftBump = new TouchSensor(SensorPort.S2);

        SensorPort.S2.addSensorPortListener(new LTouchListener());

        System.out.println("Press any button to start robot");
        Button.waitForAnyPress();
        LCD.clear();
        System.out.println("Press ENTER to stop robot");
        Motor.B.forward();
        Motor.C.forward();
        try{
            Thread.sleep(10000);}
        catch(Exception e){
            // Nothing
        }
    }
}
```

- Here the listener is the following:

```
public class LTouchListener
    implements SensorPortListener{
    public void stateChanged(SensorPort port,
                            int oldValue, int newValue){
        if(newValue <500){
            Motor.B.stop();
            Motor.C.stop();
        }
    }
}
```

- stateChanged is the function that gets called when something happens to the sensor.

- The values handled by `stateChanged` are raw values.
- Output of the ADC connected to the sensor.
- Value between 0 and 1023.
- You have to figure out what is a good threshold value.
- The remote controller is handy for this.

# Controller

The NXI Control Center window displays a table of connected devices and a sensor monitoring section.

Name	Protocol	Address	Status
Bumblebee	Bluetooth	00165311176B	DISCONNECTED
Robot04	Bluetooth	0016531AA711	LCP_CONNECTED

Buttons: Search, Disconnect

Radio buttons:  USB  Bluetooth  Both  
 LCP  RConsole  Data Log

Tabbed interface: Files, Settings, Monitor, Control, Miscellaneous

**Sensor Monitoring Section:**

Set Sensor type & mode  
Port: S2  
Type: Touch Sensor  
Mode: Raw  
Set Sensor

Sensor Port	Raw Value	Scaled Value	Mode
Sensor Port 1	-1	-1	No Sensor
Sensor Port 2	1023	1023	Touch Sensor
Sensor Port 3	-1	-1	No Sensor
Sensor Port 4	-1	-1	No Sensor

Update button

# Advantages of listeners

- You don't have to think so much about the effect of concurrency.
- No need to write a control loop that checks for, or waits for, a button press to stop motors.
- Write the control loop to do its thing.
- Have the button listener stop the motors.
- Particularly useful if you are using behaviors.
- Listeners turn on and off the semaphores that determine which behaviors can take control.
- Arbitrator then does its selection.

- Most threads set up by LeJOS
  - Pilots
  - Navigation
  - etc

can be equipped with Listeners.

- Check the API documentation for details.

# Summary

- This lecture covered a miscellany of topics that will be useful in the assignment.
- Bluetooth communication.
- Listeners for buttons, sensors etc.
- You should now have all the information you need to complete the first assignment.
- There is still more information at [www.lejos.org](http://www.lejos.org)
